

DEMO NINJA

Team: Mike Zornek

Clash Tech Points

No "special point" technologies were used in favor for an opportunity to work in Swift (last project was ObjC) and work on an app I myself want to use.

What I Learned

Stack View Experiments

Manual Table View Scrolling

Swift-Markdown Parser

Unit Testing

In the Future

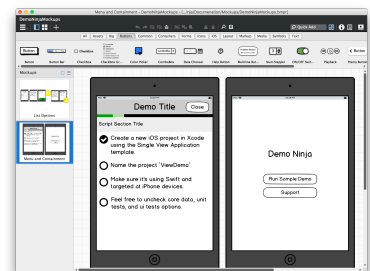

I'd love to connect DemoNinja to the Mac to allow code pasting to Xcode from the script. I'd also like to include reference images and other meta info.

Right now all the scripts are included in the bundle. In the future we'd like to be able to open from GitHub, Dropbox, iCloud and more.

Demo Ninja: Helping You Master the Demo!

Giving live code demos is a common requirement of BNR instructors and employees. Most demo scripts are passed around in plain text files -- but using these live as you run a demo can be inconvenient and error prone.

DemoNinja is a iPad app that helps display the next steps of a demo in large, easy to see text while letting the instructor progress with simple taps and gestures.

Scripts are provided to Demo Ninja in a Markdown document, letting the script be used even if Demo Ninja is unavailable, as well as working well with git repos.
